INTRODUCTION

BACKGROUND
Diarrhoeal diseases are the most common illnesses resulting from unsafe food, with 550 million people falling ill each year, including 220 million children under the age of 5 years. Salmonella is 1 of the 4 key global causes of diarrhoeal diseases. Hence the need for serotyping of Salmonella to improve diagnosis, identify sources of infection and improve food safety.

Salmonella is a Gram-negative, rod-shaped bacteria. The genus consists of about 2,600 different serotypes described in the Kauffmann-White scheme. Determination of O (somatic) and H (flagellar) antigens by using specific antisera enables identification of the antigen combinations, and thus differentiation of the many serotypes.

For more than 75 years SSI Diagnostica has been engaged in the development of the Salmonella typing system and in the production of diagnostic Salmonella antisera. We offer the full product range of Salmonella antisera to determine all the serotypes described in the Kauffmann-White Scheme.

DESCRIPTION
Our Salmonella antisera are intended for serological confirmation and serotyping of Salmonella. Our product range includes more than 200 different Salmonella antisera, which are divided into O group pool, O group, O factor, H phase pool, H phase, H factor, H:R-phase and H phase inversion antisera. All antisera for slide agglutination are available in 3 mL bottles sufficient for 150 tests. Our antisera for serological confirmation, O group pool and H phase pool antisera are also available in 1 mL bottles sufficient for 50 tests.

The diagnostic O and H antisera are polyclonal and produced by immunizing rabbits. The Vi antibody is monoclonal and concentrated from a hybridoma culture supernatant.

Advantages of SSI Diagnostica Salmonella antisera
• Quick results, read within 10 seconds
• Only 20 µL antiserum is used per test
• Our antisera are quality controlled and free of any known cross-reactions
• High quality with clear reliable results hence no ambiguous interpretation
• IVD Certified and CE Marked

Our H antisera for phase inversion are high titer and intended for use in swarm agar plates. These antisera are available in 3 mL bottles sufficient for 30 tests.

PRODUCT RANGE
• Poly antisera for serological confirmation
• More than 200 different antisera (O group pool, O group, O factor, H phase pool, H phase, H factor, H:R-phase and H phase inversion sera) for partial or complete serotyping
• Salmonella Big Five Kit – ISO 6579-3
• Sero-Quick Group kit for serotyping to the serogroup level
• Sero-Quick ID kit for serotyping of S. Enteritidis and S. Typhimurium
PHASE INVERSION

Description
Many Salmonella serotypes are diphasic which means that they can appear in two phases. However, a Salmonella bacterium expresses only one phase at a time, e.g. S. Typhimurium (1,4,[5],12:i:1,2) either expresses the phase 1 antigen H:i or the phase 2 antigens H:1,2. In a Salmonella culture there is usually only one dominating phase which is called phase 1 and this phase can be determined on swarm agar without adding phase inversion antiserum. Phase 2 is determined by adding the corresponding phase inversion antiserum for phase 1 to the swarm agar. This allows the bacteria to swarm by expressing the phase 2 H antigens.

Swarm agar
Swarm agar (Schwörm agar) is a soft nutrient-rich medium that allows motile Salmonella to swarm. The medium is used with or without phase inversion antiserum in order to determine the H-phases of Salmonella (the Sven Gard method). SSI Diagnostica swarm agar products are:

- 200 mL bottles (Schwörm agar art. no. 29565)
- 60 mL bottles (Schwörm agar, art. no. 82491)

SLIDE AGGLUTINATION

The slide agglutination test is done on a glass slide and read with the naked eye in front of a light source against a black background. Our Salmonella antisera has a quick reaction time and the result is read within 10 seconds.

Procedure
1. Add a small drop of antiserum (approx. 20 µL) on a glass slide and mix it with the Salmonella culture.
2. Tilt the slide for 5 - 10 seconds.
3. A positive reaction is seen as visible agglutination, whereas a negative reaction is seen as homogeneous milky turbidity (Figure 1).

Figure 1. Sample A is a positive reaction and sample B is a negative reaction.
Procedure

Day 1
• Pour 10 mL swarm agar into a petri dish (6 cm in diameter).
• Leave the petri dish on a levelled table to solidify.
• Inoculate the plate in the centre with a loop full of *Salmonella* culture without breaking the surface of the medium and incubate the plate on a levelled table at 37°C overnight.

Day 2
• The phase 1 H antigens are determined by doing slide agglutinations with culture from the periphery of the swarm.
• Apply 2 drops of phase inversion antiserum against the phase 1 H antigens to a petri dish and mix with 10 mL swarm agar (see Figure 2).
• When the swarm agar has solidified, inoculate the plate and leave it at 37°C overnight.

Day 3
• The phase 2 H antigens are determined by doing slide agglutination with culture from the periphery of the swarm.

FULL SEROTYPING

Complete serotyping of a *Salmonella* culture is described in the 2 flowcharts below. The first flowchart shows the standard serotyping procedure. The second flowchart describes all the steps of serotyping the S. Enteritidis and S. Virchow, respectively.

Note: Some *Salmonella* O antisera will agglutinate with other bacteria, e.g. *Citrobacter* spp., *Proteus* spp. or *Shigella* spp. as their O antigens can be very similar to the *Salmonella* O antigens. It is therefore crucial to confirm the identification of the *Salmonella* genus with for example a biochemical test, before the serotyping is initiated.

SALMONELLA SEROTYPING FLOWCHART

1. **Biochemical confirmation**
2. **Poly A-S+Vi**
   - Poly 42-67
3. **O group pool antisera**
   - OMA → OMG
4. **O group antisera**
   - O factor antisera
5. **H phase pool antisera**
   - HMA → HMG
6. **H phase antisera**
   - H factor antisera
   - Use Phase inversion antisera
7. **H phase pool antisera**
   - HMA → HMG
8. **H phase antisera**
   - H factor antisera
9. **Serotype identified in the Kauffmann-White scheme**

1. **Confirmation**
2. **O antigen determination**
3. **H antigen determination**
4. **Nomenclature determination**
FULL SEROTYPING OF S. ENTERITIDIS AND S. VIRCHOW

If the first phase expressed is H:1,2 use SG6 for phase inversion and identify the second phase.

**Serotype: Salmonella Enteritidis 1,9,12:g,m:-**
- O:9 and O:12 positive
- HMB positive
- H:G positive
- H:m positive
- OMA positive
- Test against: HMA, HMB, HMC, HMD, HME, HMF and HMG

**Serotype: Salmonella Virchow 6,7,14:r:1,2**
- O:6,7,8; O:6,14,24,25; O:61 and O:7 positive
- HMB positive
- H:r positive
- HMD positive
- H:2 positive
- OMA: Positive
- Test against: HMA, HMB, HMC, HMD, HME, HMF and HMG

Test against the factor antisera: H:f, H:m, H:p, H:q, H:s, H:t, H:u and H:z51

Poly A-S+Vi Positive
- Test against: OMA, OMB, OMC, OMD, OME, OMF and OMG

Culture on swarm agar

Use phase inversion antisera H:r

H2 positive

No swarm: the strain is monophasic

Phase inversion antisera SG6

If the first phase expressed is H:1,2 use SG6 for phase inversion and identify the second phase.
SALMONELLA ANTISERA KITS

We offer 3 kits - Salmonella O sero-group kit, Salmonella sero-quick ID kit and Salmonella Big Five kit. The Salmonella sero-group kit is used to determine the most common Salmonella groups and the Salmonella sero-quick ID kit is used to identify the two most commonly occurring Salmonella serotypes namely S. Enteritidis and S. Typhimurium. Our Salmonella Big Five kit facilitates Salmonella serotyping according to ISO/TR 6579-3.

SERO-QUICK GROUP KIT
FOR QUICK SEROGROUPING OF SALMONELLA

Description and Application
The Salmonella Sero-Quick Group kit with 8 different ready-to-use antisera is for identifying Salmonella isolates at the serogroup level. Our kit antisera are for the most common serogroups of Salmonella, serogroups i.e. A-G and the capsular antigen Vi. The antisera are vials in differentiated volumes according to standard lab use. The Salmonella Sero-Quick Group kit can be used to perform about 100 tests.

This kit can be used as a surveillance tool either for preliminary Salmonella sero-grouping or when full serotyping is performed by a Human or Veterinary Reference Centre. In the food industry it can be used for screening of Salmonella. The most common serogroups are B (S. Typhimurium) and D, (S. Enteritidis). Vi and serogroup A are clinically important as they are expressed by S. Typhi and S. Paratyphi respectively.

The kit is intended for slide agglutination of Salmonella cultures after overnight growth on suitable culture medium, e.g. beef extract agar. We recommend the procedure described in Figure 3.

PRODUCT RANGE
- Article No. 60898: Salmonella Sero-Quick Group kit, 1 box
- Article No. 62984: Salmonella Sero-Quick ID kit, 1 box
- Article No. 89074: Salmonella Big Five kit – ISO 6579-3, 1 box

Figure 3. Serogrouping with Salmonella Sero-Quick

Send the strain to a reference laboratory for serotyping
The 8 antisera are used as indicated in Figure 4. Begin with the O antisera followed by the H antisera and then the phase inversion antisera. The H:q,s,t,p,u antisera is used to exclude that the antigens H:s, H:t and H:q which do not combine with antigen combination H:g,m in serogroup O:9 (D1). Additional serotyping to identify additional serotypes can be done.

SERO-QUICK ID KIT
FOR QUICK IDENTIFICATION OF S. ENTERITIDIS AND S. TYPHIMURIUM

**Description and Application**
The *Salmonella* Sero-Quick ID kit is intended for complete serotyping of *S. Enteritidis* (1,9,12:g,m:-) and *S. Typhimurium* (1,4,5,12:i:1,2). The kit facilitates quick identification of the two most common serovars isolated in humans - *S. Enteritidis* and *S. Typhimurium* constitute 81% of all *Salmonella* strains isolated from humans. Therefore, it is very important to serotype these strains quickly.

The kit consists of 8 different ready-to-use antisera: O:4, O:9, H:i, H:m, H:2, H:q,s,t,p,u, SG2 and SG6 which are available in 2 ml vials. About 100 tests can be performed with the Sero-Quick ID kit.

The kit consists of 8 different ready-to-use antisera: O:4, O:9, H:i, H:m, H:2, H:q,s,t,p,u, SG2 and SG6 which are available in 2 ml vials. About 100 tests can be performed with the Sero-Quick ID kit.

n.p. = not performed
a  = SG2 is used for phase inversion of strains initially expressing H:i
b  = SG6 is used for phase inversion of strains initially expressing H:1,2

**Limitations**
*S. Hillingdon* (8,46:g,m:-) cannot be distinguished from *S. Enteritidis* with this kit since both serotypes will be positive in O:9 and H:m and negative in H:q,s,t,p,u. However, the prevalence of *S. Hillingdon* is very low.
**SALMONELLA BIG FIVE KIT – ISO 6579-3**

**Description and Application**

The *Salmonella* Big Five kit is used for screening of *S. Typhimurium*, *S. Enteritidis*, *S. Infantis*, *S. Virchow*, and *S. Hadar* according to ISO 6579-3 (Figure 5). These are the five most common *Salmonella* types isolated in humans. The kit has all the antisera to screen for the Big Five *Salmonella*. It includes O antisera (O:4, O:8, O:61, O:7, O:46), H antisera (Hq,s,t,p,u, Hi, Hr, H:z10, Hm, H:x, H:2, H:5) and H phase inversion (SG 1, SG 2, SG 5, SG 6, H:r).

The 20 different ready-to-use antisera are marketed as 3 mL (150 tests) vials in a single kit.

The kit facilitates compliance with the ISO 6579-3 Standard.

---

**Figure 5.** Flow chart showing how to serotype the five most common *Salmonella* serotypes according to ISO/TR 6579-3
GENERAL INFORMATION

Quality and Storage
SSI Diagnostica ready-to-use antisera are CE-marked and produced in accordance with DS/EN ISO 13485. The shelf life is 4 years from the date of production. Sodium azide 0.09% is added to all Salmonella antisera as a preservative.

The antisera must be stored at 2–8°C.
